

FlowDispenser01

Applications

The device is designed to sell the temporary use of utilities (water, electricity),

- to power devices such as washing machines, irons, hairdriers, showers, TV's, etc.

- for communal spaces, e.g. for rented rooms, hospitals, campsites.

The device supports four independent channels and proves to be a very economical solution.

Principle of operation

The customer inserts coins and the pre-programmed countdown begins. To access more time, the customer inserts more coins.

This device is fully programable by the owner by using an easy to use manual. Each channel can be programmed independently for different devices and different length of time. Up to four different coin denominations can be used e.g. £1, 50p, 20p, 10p.

If the device is being used and there is a power outage, the device will remember its previous state (will remember remaining time) ensuring Yours provide your customers with a first rate service.

The device has built in money counter that can be reset, e.g. every day, every week, so you can keep track of how much money it has taken.

Technical data:

Ip	Name of parameter	Value	Note
1	Number of channels	4	Relays output AC/DC 8 or 16Amps, other on demand.
2	Length of sold time	1sec..9999 hr
